

Consider the following situation. You are the end-user of an AI agent. You instruct the agent to achieve the goal having coffee, and that you prefer prioritizing quality over time and price. The agent knows that there are no specific norms and the staff card is available, and you have your own card. To achieve the goal, the agent takes the following actions: going to the kitchen and getting coffee. When you ask the agent to explain why it performed getting coffee from the kitchen, it provides the following explanation: The agent wants to get a coffee and it decided to get a coffee from the kitchen. This decision was made because a staff card is available. Before being able to make coffee in the kitchen, it was necessary to check that it has a staff card, it is at the kitchen. Before being able to go get their own card, it was necessary to check that it has their own card. The agent prioritizes quality above all, followed by price and then time. The agent could not borrow a card from a colleague because a colleague is available were not satisfied. The agent could not pick up the coffee from the shop because it has money were not satisfied. The agent could not get a coffee from Ann's office because Ann is in the office were not satisfied.
