

Consider the following situation. You are the end-user of an AI agent. You instruct the agent to achieve the goal having coffee, and that you prefer prioritizing quality over time and price. The agent knows that it is prohibited to go to Ann's office and the staff card is available, you have your own card, a colleague is available, you have money, and Ann is in her office. To achieve the goal, the agent takes the following actions: going to the shop, paying at the shop, and getting coffee. When you ask the agent to explain why it performed paying at the shop, it provides the following explanation: The agent wants to get a coffee and it decided to pick up the coffee from the shop. This decision was made because it has money. Before being able to pay at the shop, it was necessary to check that it has money. The agent prioritizes quality above all, followed by price and then time. Moreover, choosing to get a coffee from Ann's office would have violated a prohibition, so it was excluded. The agent preferred to pick up the coffee from the shop over get a coffee from the kitchen because it had a lower overall cost, especially with quality as the top priority. To have the coffee then the agent needed to pay at the shop and pick up the coffee at the shop.
