

Consider the following situation. You are the end-user of an AI agent. You instruct the agent to achieve the goal having coffee, and that you prefer prioritizing price over time and quality. The agent knows that it is prohibited to pay at the shop and the staff card is available, you have your own card, a colleague is available, and you have money. To achieve the goal, the agent takes the following actions: going to the kitchen and getting coffee. When you ask the agent to explain why it performed going to the kitchen, it provides the following explanation: The agent wants to get a coffee and it decided to get a coffee from the kitchen. This decision was made because a staff card is available. Before being able to go get their own card, it was necessary to check that it has their own card. The agent prioritizes price above all, followed by time and then quality. Moreover, choosing to pick up the coffee from the shop would have violated a prohibition, so it was excluded. The agent preferred to go get their own card over borrow a card from a colleague because it had a lower overall cost, especially with price as the top priority. The agent could not get a coffee from Ann's office because Ann is in the office were not satisfied. To have the coffee then the agent needed to go to the kitchen and make coffee in the kitchen.
